Analyze various types of servers using webalize tool

Aim:

To Analyze the performance and usage statistics of a web server using the webalizer log analysis tool

Algorithm:

1. Initialize web server
   - -> Install apache HTTP server.
   - -> Start the web server service (systemctl start httpd")
   - -> Enable service startup on boot.
2. Generate Traffic logs
   - -> Access the web server via browser request (http://localhost)
   - -> Verify the incoming request entries in access log files (/user/log/httpd/access.log)
3. Install log Analyzer
   - -> Install log the webalizer tool (sudo dnf install webalizer)
4. Create prase & Analyze logs
   - -> Create input HTML report directions (/var/www/html/webalizer)
   - -> Execute webalizer with elevated privileges (sudo to read protected access log

Output:

Summary by month

month	visits	page	Fils	Hits	12Bytes
Jan 26	1250	3420	5210	7845	45820
Feb 26	1480	3915	5740	8140	52140
Mar 26	1635	4250	6210	8920	587660
Total	4865	11555	1760	24415	156780

Code:

200 ok 21800

301 moved prime number

404 Not found 1200

500 server error LS.

?) parse each record in the log file line by line.

5. Generate & display reports

-> Aggregate passed into monthly, daily summaries

-> Export formated HTML pages visual to the output

-> Open a browser and load (http://localhost) webalizer to review and compare server traffic pattern.

RESULT:

The webalizer web log analysis tool was successfully configured & executed
